

INTERACTION OF LIGHT WITH MATTER: SCATTER, ABSORPTION

MIKLÓS KELLERMAYER

INTERACTION OF LIGHT WITH MATTER

SCATTERING OF LIGHT

What are these days?
Crepuscular rays
(St. Peter's basilica)

Why is the sky blue?

What makes the sunset red?

SCATTERING OF LIGHT

How large is the scattered ("re-radiated") light's power? (P_{scatt} ; dimension $W = Fd t^{-1}$)

N.B. - Coulomb's law: $F \sim \frac{Q_1 Q_2}{r^2}$ (dimension $Q^2 d^{-2}$)

| Physical parameter | Dimension | Operation |
|--------------------------|-----------------------|-------------------------------------|
| p_0^2 | $Q^2 d^2$ | Square |
| p_0^2 | $Q^2 d^2 d^4 = F d^4$ | Expand with $d^2 d^2$ |
| p_0^2 / c^3 | $F d t^3$ | Divide by c^3 ($d^3 t^{-3}$) |
| $(p_0^2 / c^3) \omega^4$ | $F d t^{-1} = W$ | Multiply by ω^4 (t^{-4}) |

$$P_{scatt} = \frac{p_0^2}{c^3} \omega^4$$

LIGHT SCATTERING

- Elastic collision: photon energy (wavelength) does not change
- Emission by resonating dipoles
- Scattering particles far from each other

$$J_s = J_0 \frac{8\pi^4 N \alpha^2}{\lambda^4 R^2} (1 + \cos^2 \Theta)$$

J_s = intensity of scattered light
 J_0 = intensity of incident light
 N = number of scattering particles
 α = polarizability (dipole moment per electric field)
 λ = wavelength of light
 R = distance between scatterer and observer
 Θ = angle between light source and observer

Strong wavelength dependence → enhancement of short wavelengths → blue sky

If scatterers are interacting particles the the overall size of which is comparable to the wavelength → interference, cancellation → gray clouds

DYNAMIC LIGHT SCATTERING (DLS)

Intensity of scattered light fluctuates in time

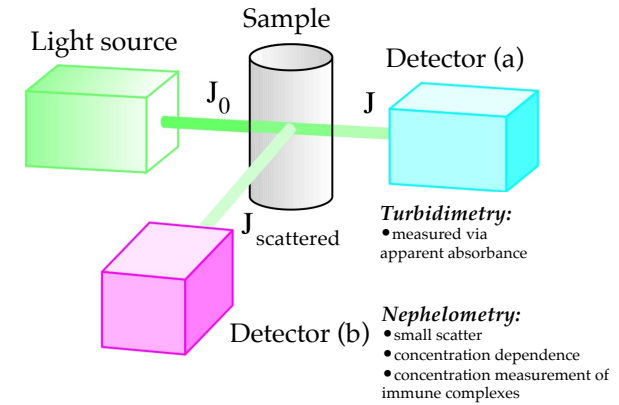

Fluctuation rate depends on particle size

- From the autocorrelation function ("self-similarity") of temporal intensity fluctuation the diffusion constant (D) can be calculated.
- From the diffusion constant the radius (r) of the spherical particle can be calculated (Stokes-Einstein):

$$D = \frac{k_B T}{6\pi\eta r}$$

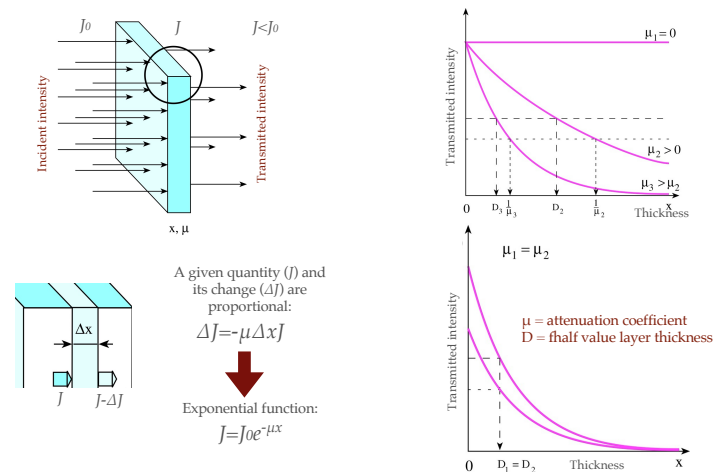

BIOMEDICAL APPLICATIONS OF LIGHT SCATTERING

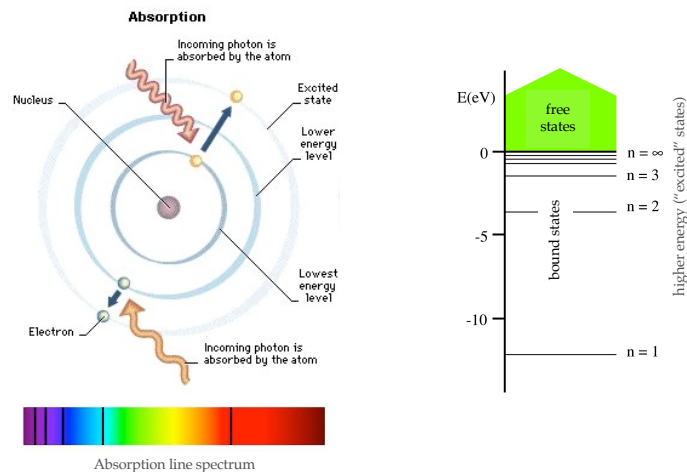

INTERACTION OF LIGHT WITH MATTER

GENERAL ABSORPTION (ATTENUATION) LAW

LIGHT ABSORPTION BY AN ATOM

PARAMETERS AND MEASUREMENT OF ABSORPTION

Absorbance (A): $A = \lg \frac{J_0}{J} = \lg e \cdot \mu \cdot x$ Dimensionless number
Synonyms: extinction, optical density (OD)

Transmittance (T): $T = \frac{J}{J_0} \cdot 100$ Expressed in percent (%)
Synonym: transmission coefficient

Photometry
 ("measurement of light"):

STATE OF A MOLECULE IS AFFECTED BY ITS MOTIONAL MODES

Molecule: atoms connected by chemical bonds
 Simplest case: diatomic molecule
 (e.g., hydrogen molecule)

Molecules **vibrate** and **rotate**!

Vibration: periodic motion **along** the axis of the covalent bond
Rotation: periodic motion **around** the axis of the covalent bond

Examples of vibrational motion in the triatomic methylene group ($-\text{CH}_2-$):

ENERGY OF A MOLECULE

Max Born
(1882-1970)

J. Robert Oppenheimer
(1904-1967)

Born-Oppenheimer approximation:

$$E_{total} = E_e + E_v + E_r$$

Important notions:

Types of energy states are independent (not coupled)

Energy states are non-continuous, but discrete

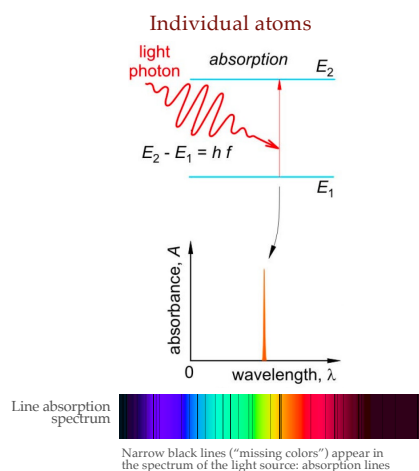

Transition between states involves packets (quanta) of energy

Scales of transition energies between different states are different:

$$E_e \sim 100\times E_v \sim 100\times E_r$$

$$\sim 3 \times 10^{-19} \text{ J } (\sim 2 \text{ eV}) > \sim 3 \times 10^{-21} \text{ J} > \sim 3 \times 10^{-23} \text{ J}$$

ORIGIN OF THE BAND SPECTRUM

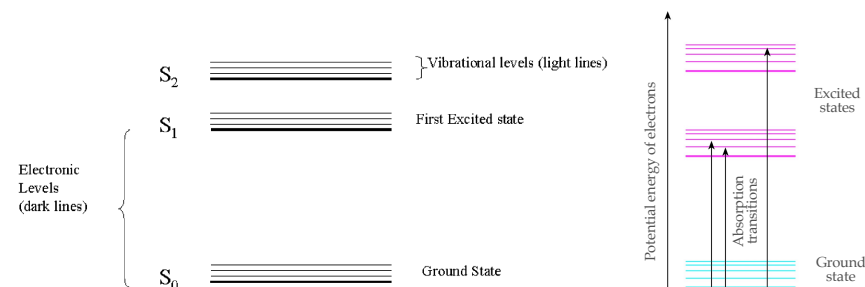

REPRESENTATION OF ENERGY STATES

Jabłoński diagram:
illustrates the electronic states of a molecule and the transitions between them (with arrows)

Alexander Jabłoński
(1898-1980)

MOLECULES HAVE BAND ABSORPTION SPECTRA

General attenuation law:

$$A = \lg \frac{J_0}{J} = \lg e \cdot \mu \cdot x$$

For dilute solutions - Lambert-Beer law:

$$A_\lambda = \lg \frac{J_0}{J} = \epsilon_\lambda \cdot c \cdot x$$

ϵ_λ = molar extinction coefficient
 c = concentration

- SI unit of molar extinction coefficient (ϵ_λ): $\text{m}^2\text{mol}^{-1}$
- Method ideal for concentration measurement
- Based on the wavelength (at maximum) the transition energy may be calculated:

$$E_2 - E_1 = E_{\text{photon}} = h \cdot f = h \cdot \frac{c}{\lambda}$$

ABSORPTION SPECTROSCOPY

- **Spectrum:** intensity (or its derived units, e.g., OD) as a function of photon energy (or its derived units, e.g., frequency, wavelength).
- **Spectroscopy:** qualitative analysis of the spectrum.
- **Spectrometry, spectrophotometry:** quantitative analysis of the spectrum.
- **Applications:** analysis of chemical structure, concentration measurement, etc.

PULSE OXYMETRY

Non-invasive measurement of oxygen saturation (SO_2)

- % of HgB that carries O_2 is measured
- Arterial oxygen saturation (SO_2) is estimated from the peripheral (SpO_2)
- Normal value: 95-99%
- Ratio measurement is carried out (red/IR)
