

Biophysics

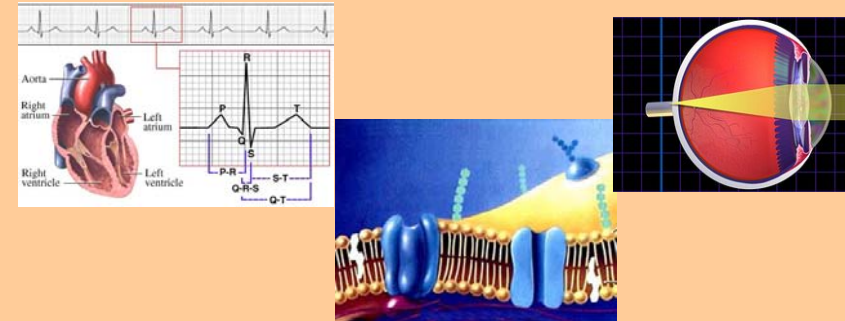

Gabriella Csik

csik.gabriella@med.semmelweis-univ.hu

What is the subject of biophysics?

Physical aspects/background of biological processes

E.g., Electrophysiology of heart, structure and functioning of membranes, sensory function stb.

What is the subject of biophysics?

Physical methods in biology and medicine

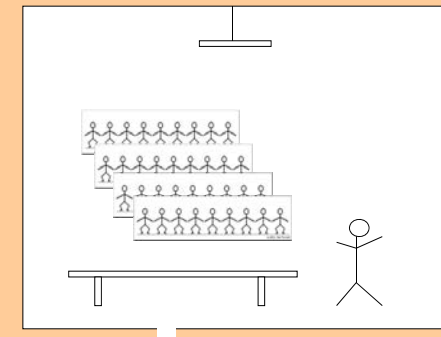

E.g., ECG, X-ray diagnostics, microscopy....

Radiation

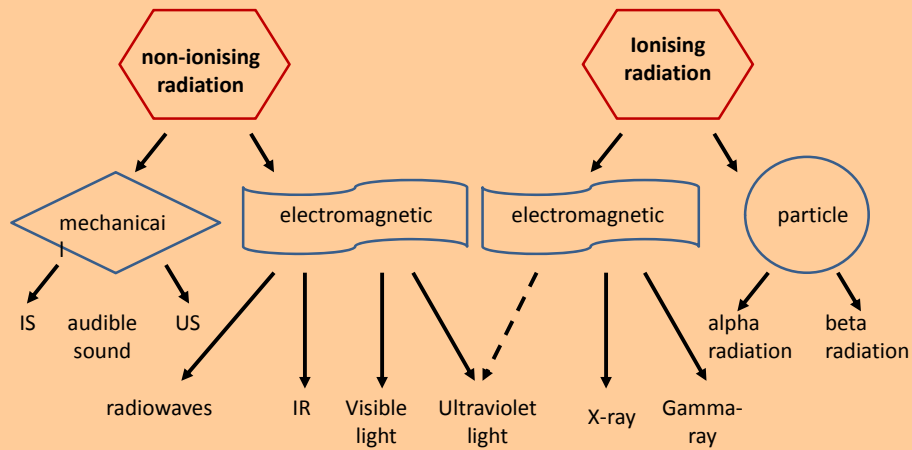

Examples around us

sound
light
radiowaves
nuclear radiation

Radiation: emission and propagation of energy

Radiation

Nature of light

Wave?

Christiaan Huygens

(1629 - 1695)

Traité de la lumière
1690

Particle?

Isaac Newton

(1642 - 1727)

Opticks
1704

Natur of waves

periodic disturbance in space and time, possibly transferring energy to or through a spacetime region.

Waves differ in
type of energy
amplitude
mechanism of propagation

Characteristic values

Period in space— *wavelength*

λ [m] or [nm]

Highest displacement – *amplitude*

$$E \sim A^2$$

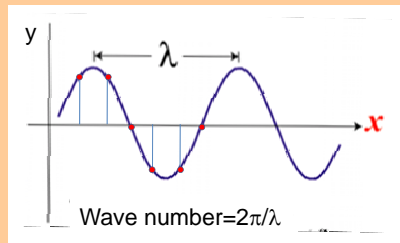

Period in time

– *period*
– *frequency*

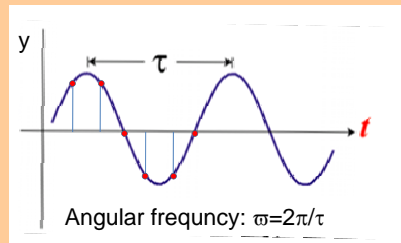

$$f = \frac{1}{\tau} \left[\frac{1}{s} \right]$$

Phase: the initial angle of a sinusoidal function at its origin

$$\phi(x) = kx + \phi_0$$

$$\phi(t) = \omega t + \phi_0$$

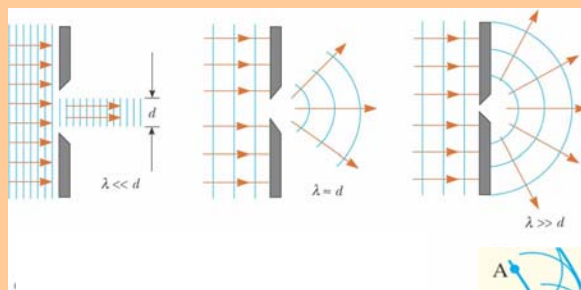

$$\phi = \omega t + kx + \phi_0$$

Indication of wave nature

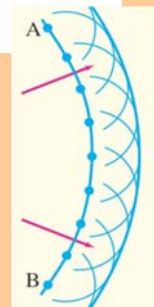

- diffraction
- superposition/interference
- polarization

Diffraction

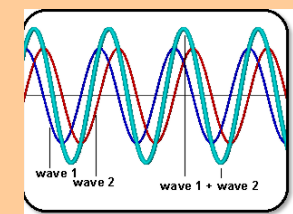

Huygens-principle: every point on a propagating wavefront serves as the source of spherical secondary wavelets, such that the wavefront at some later time is the envelope of these wavelets.

Superposition: The principle of superposition may be applied to waves whenever two (or more) waves traveling through the same medium at the same time. The net displacement of the medium at any point in space or time, is simply the sum of the individual wave displacements.

Un-equal frequencies

Equal frequencies

Interference: superposition of coherent waves

Similar phase

Constructive interference

$$\Phi = 0^\circ$$

Opposite waves

Destructive interference

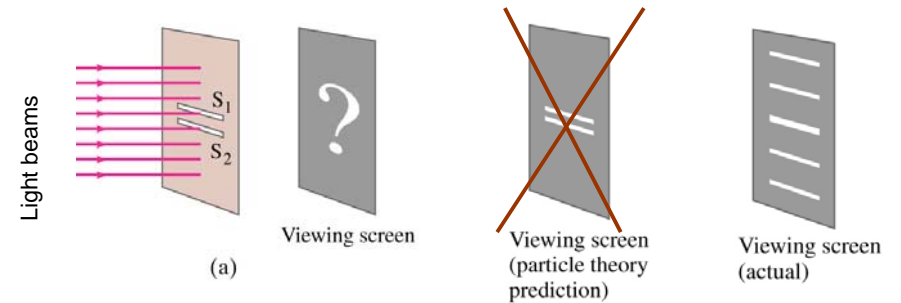

$$\Phi = 180^\circ$$

Thomas Young
(1773-1829)

Wave or particle?

1. Thomas Young's double-slit experiment

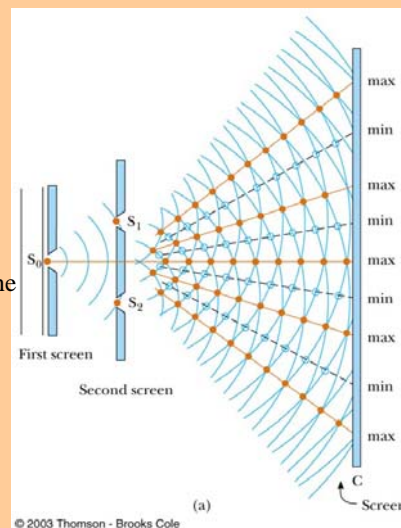

Interpretation of Thomas Young's double-slit experiment

S_1 and S_2 slits are wave sources

Two waves from S_1 and S_2 originate from the same wave front that is they are in the same phase.

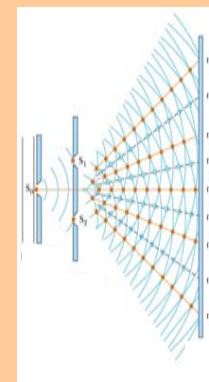

interference

Interference fringes on a screen

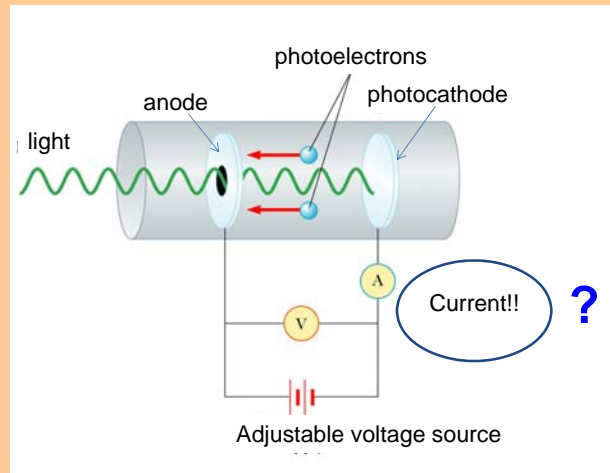

Dispersion of light by diffraction grating

2. Hertz's experiment

Heinrich Hertz
1887

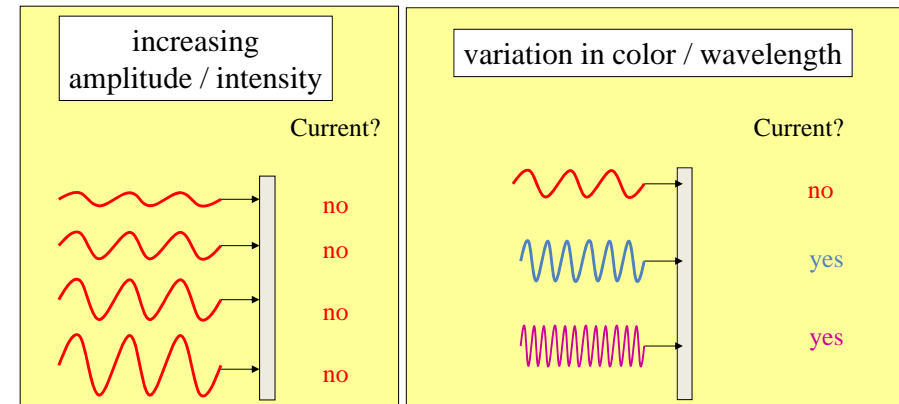

Photoelectric effect

Current ?

Light irradiation

Similar color / wavelength

Similar amplitude

No current up to a critical value of frequency

Interpretation of photoelectric effect

- Based on the wave character it is not possible.

- Planck – foundation of quantum physics

$$E = hf$$

- Einstein's concept is based on the quantum theory

Max Planck

Albert Einstein

Nobel Prize in physics 1918

Nobel Prize in physics 1921

*"in recognition of the services he rendered to the advancement of Physics by his **discovery of energy quanta**".*

*for his services to Theoretical Physics, and especially for his **discovery of the law of the photoelectric effect**".*

Einstein interpretation

- Light consists of a finite number of energy quanta - photons
- The energy of photon: $E = hf$
- Photon can be absorbed or generated only as complete units.
- A photon transfer its energy to one electron if the photon energy is equal or higher than the work function (A).
- No interaction, if the photon energy is smaller than the work function.
- 1 photon– 1 electron interaction
- Kinetic energy of the electron: $E_{kin} = hf - A$

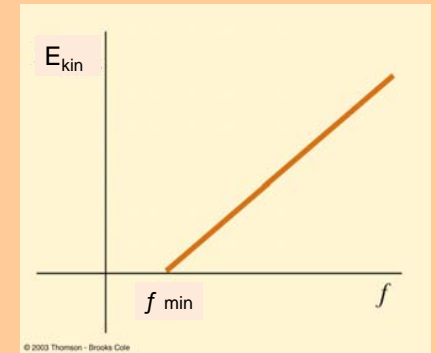

Einstein interpretation and the frequency limit

Kinetic energy of electron proportional to the frequency.

Intercept with the x axis is the smallest frequency inducing photoelectric effect

f_{min} depends on the cathode material:

$$A = hf_{min}$$

Dual nature of light

Particle – its energy is quantised; a photon is an elementary particle, the quantum of the electromagnetic interaction

Energy of photon: $E = hf = h \frac{c}{\lambda}$

Planck constant: $h = 6.62 \cdot 10^{-34} \text{ Joule} \cdot \text{s}$

It has no resting mass

Propagates in vacuum

Calculation of photon energy

$$E = h \times \frac{c}{\lambda}$$

If $\lambda = 400 \text{ nm}$

$$E = 6.6 \times 10^{-34} \text{ Js} \times \frac{3 \times 10^8 \frac{\text{m}}{\text{s}}}{4 \times 10^{-7} \text{ m}} = 4.95 \times 10^{-19} \text{ J}$$

$$E = \frac{4.95 \times 10^{-19} \text{ J}}{1.6 \times 10^{-19}} = 3.1 \text{ eV}$$

$$E_{\text{vis}} = 1.6 - 3.1 \text{ eV}$$

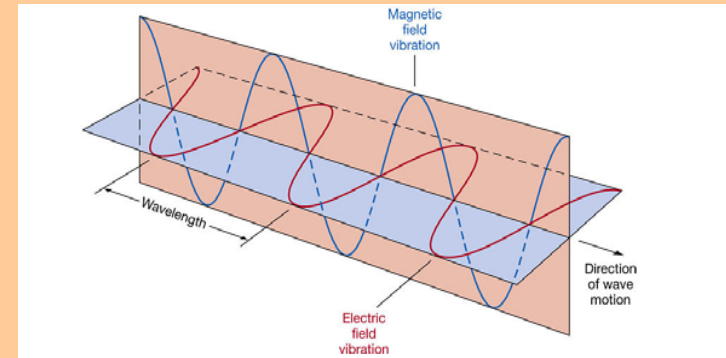

How much

- 1 TeV: kinetic energy of a fly
- 200 MeV: energy released during nuclear decay of ^{235}U atom
- 13.6 eV: ionizing energy of H atom
- 2.5 eV: energy of bluish light photon
- **1/40 eV: kT energy at room temperature**

Dual nature of light

Wave – electric and magnetic fields vary sinusoidally

Electromagnetic radiation

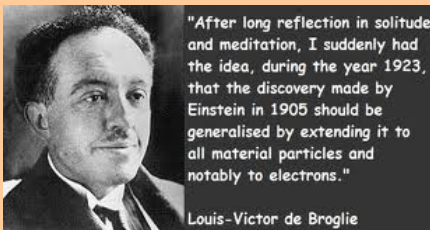

Why only light could have dual nature?

De Broglie concept: the wave-particle duality

All particles exhibit both **wave** and **particle** properties

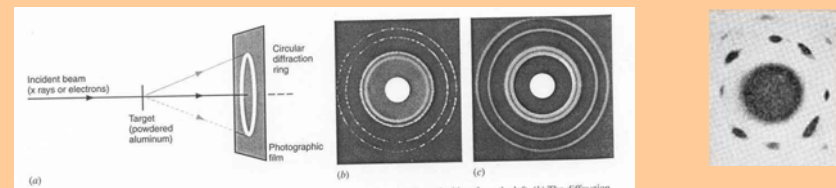

Momentum of the electron: $p = m_e v$

$$\lambda = h / p$$

$$E = hf = h \frac{c}{\lambda}$$

Particles ARE Waves!

Electrons indeed behave exactly as if they were waves.

Clinton Joseph
Davisson

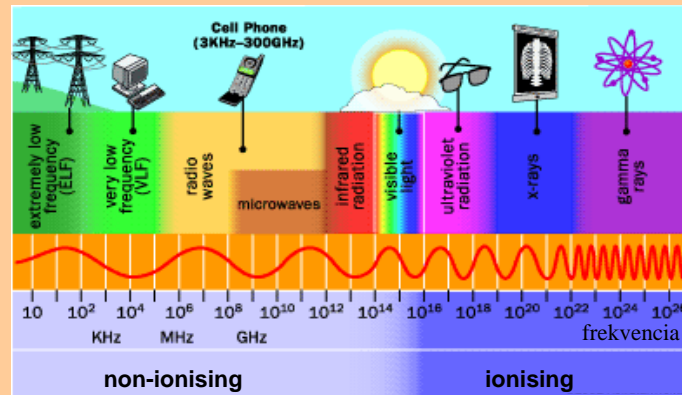

George Paget
Thomson

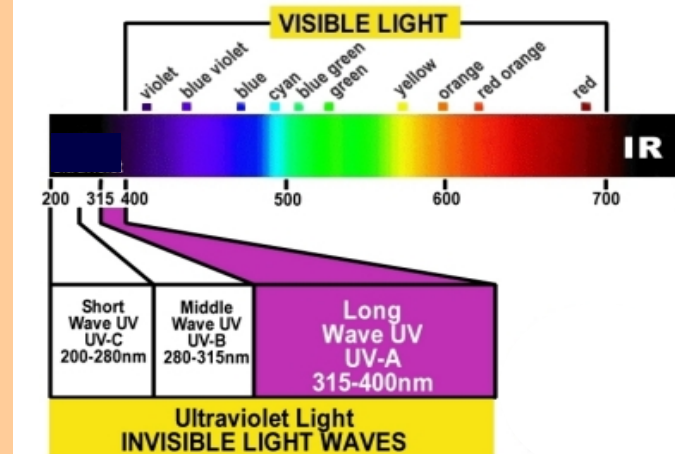

Nobel Prize in Physics 1937

"for their experimental discovery of the diffraction of electrons by crystals"

Ranges of electromagnetic radiation

Optical range

Question: Which object can have similar size as the wavelength of microwaves, visible light or soft X-ray?

10^{-5} eV – microwave

2 eV – visible light

100 eV – X-ray
