

Generation of light - Light sources

Black-body radiation

Luminescence

Laser

Luminescence

Repetition

Types of energy states in atoms and molecules are independent
(not coupled)

Energy states are non-continuous, but discrete

Transition between states involves packets (quanta) of energy)

$$E_{total} = E_e + E_v + E_r$$

Scales of transition energies between different states are different:

$$E_e > E_v > E_r$$

Consider a single atom

- Energy states are discrete
- Electrons occupy the lowest possible energy state (ground state)
- Pauli exclusion principle: no two identical fermions (particles with half-integer spin) may occupy the same quantum state simultaneously

Excitation modes

- absorption of radiation (UV/VIS) : *photoluminescence*
- chemical reaction: *chemo/bio-luminescence*
- Injection of charges: *electroluminescence*
- friction (mechanical deformation): *triboluminescence*
- thermally activated ion recombination: *thermoluminescence*
- Sound waves: *sonoluminescence*

Luminescence: spontaneous light photon emission by electrons when they return from their excited state to their original (ground) state of lower energy

$$hf = E_1 - E_0$$

The emitted photon energy is characteristic for the electronic orbitals, thus for the atom/molecule.

The energy of the electronic orbitals in molecules is perturbed by the discrete states of molecular vibrations

Kasha's rule:

fluorescence originates always from the vibrational state of lowest energy within the lowest electronic excited state.

Fluorescence

De-excitation by photon emission between singlet states

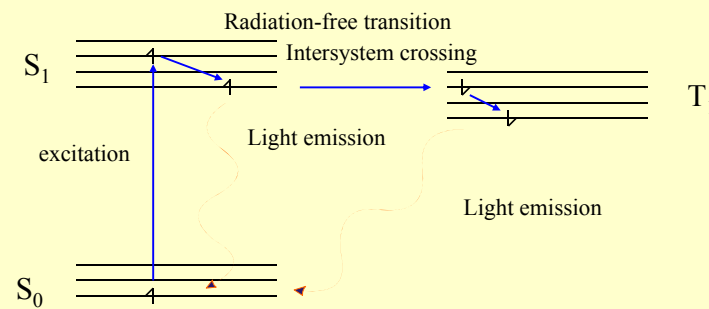

$$E_{\text{excitation}} \geq E_{\text{fluorescence}}$$

$$\lambda_{\text{excitation}} \leq \lambda_{\text{fluorescence}}$$

Stokes-shift

Emitted photon energies

Fluorescence

Phosphorescence

Stokes-shift

$$E_{\text{excitation}} \geq E_{\text{fluorescence}} > E_{\text{phosphorescence}}$$

$$\lambda_{\text{excitation}} \leq \lambda_{\text{fluorescence}} < \lambda_{\text{phosphorescence}}$$

Characteristics of emitted light

Wavelength distribution of emitted light

Emission spectrum

Wavelength distribution of emitted light

Emission spectrum

molecules:

band spectrum

$$\lambda_{\text{excitation}} \leq \lambda_{\text{fluorescence}} < \lambda_{\text{phosphorescence}}$$

Stokes shift

E.g.: Corresponding spectra of triptophane

Excited-state lifetime

Single photon counting

Measuring of time gap between excitation and photon emission. Statistical analysis of large number of measurements.

Typical excited-state lifetimes

Lifetime

the time during which the number of excited electrons decreases to its e^{th} .

Is excitation always followed by photon emission?

Excited state decay can be caused by mechanisms other than photon emission and are therefore often called "non-radiative rates,,.

These can include: chemical reaction, dynamic collisional quenching, near-field dipole-dipole interaction, internal conversion and intersystem crossing.

Is excitation always followed by photon emission?

Quantum yield

Reciprocal of the number of absorbed photons for one photon emission

Fluorescence quantum yield (Q_F)

$$Q_F = \frac{\text{number.of.photons.emitted}}{\text{numbe.of.photons.absorbed}}$$

$$Q_F \leq 1$$

Types of luminescence

fluorescence

phosphorescence

They can be characterized by

emission spectrum

types

position of peaks

amplitude

lifetime

quantum yield

Application fields of luminescence

Light sources (lightning, fertilization, sunbeds, photomedicine...)

concentration determination (flame photometer)

luminescence spectroscopy

luminescence microscopy

dosimetry (see later)

archeology

architecture

safety controll ... many more

Luminescent light sources

Metal vapor lamps

Low-pressure Na-vapor lamp

High-pressure Na-vapor lamp

Low-pressure Hg-vapor lamp

Emission spectrum

„germicid lamp”

Application in dental medicine

Red fluorescence indicates the activity of identifies cariogenic bacteria

Auto-fluorescence of teeth. When teeth are illuminated with high intensity blue light they will start to emit light in the green part of the spectrum.

amalgam restoration

Healthy and malignant tissues different fluorescent properties

Tooth native and fluorescent image

Teeth native and fluorescent images

Active caries

caries

Luminescent microscopy

Laboratory application in many ways

And more...

Question of the week

How can you explain that a typical life time of fluorescence is shorter than that of the phosphorescence?
