

## Super-Resolution Microscopy Techniques

**Szabolcs Osváth**

Semmelweis University

**Hans Jansen and Zacharias Jansen  
Build a Compound Microscope in 1590**

## Diagram of the Compound Microscope

## Point Spread Function (PSF)

The PSF is the transfer function (impulse response) of the microscope.

As a consequence of the wave character of light, the image of a point of the object is not a point, but an extended blob.

## The Effect of the Wave Character of Light on the Image

## Abbe's Principle

The smaller the detailed structure of the object, the wider the angle of diffraction.

Each spatial frequency component in the object produces diffraction at a specific angle dependent upon the wavelength of light.

Two points can be resolved in the microscope if and only if at least the first order diffracted beams are combined in the image.

### Abbe's Formula

$$\delta = 0,61 \cdot \lambda / (n \cdot \sin\alpha)$$

Tacit assumptions:

- different parts of the object are imaged simultaneously
- details of the object are distinguished by the fact that the light coming from them give distinctive image patches.

### Ernst Karl Abbe (1840-1905)

Physicist and social reformer

He placed the production of optical devices on a scientific basis.

### Super-Resolution Microscopy

2014 Nobel prize in chemistry:

- Eric Betzig
- Stefan W. Hell
- William E. Moerner

### Abbe's Principle in the Wavenumber Representation

### Structured illumination microscope

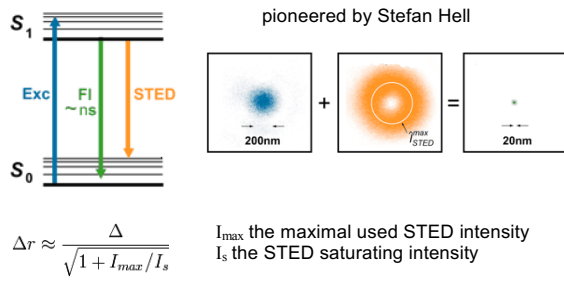

### Structured Illumination Microscope

Traditional (left) and structured illumination microscope image (right) of neural cells.

### STimulated Emission Depletion (STED) Microscope

### STimulated Emission Depletion (STED) Microscope

Organization of synaptophysin in reused synaptic vesicles.

### Localization

### Localization and Co-Localization

### Photo-Activated Localization Microscopy (PALM)

Invented by Eric Betzig and Harald Hess

### Photo-Activated Localization Microscopy (PALM)

CD63, lysosome transmembrane protein

Structure of the microtubules in PtK1 cells, expressing human tubulin tagged by m-KikGR the fluorophore.

Figure 1 consists of seven panels (A-G) showing fluorescence microscopy images of Drosophila ommatidia. Panel A shows a whole ommatidium with Drosophila (green) and cone (magenta) cells. Panels B-G show higher magnification views of the cone cell layer, highlighting the arrangement of cone cells and their projections. Scale bars are provided for each panel.

This family of microscopes creates a topographic image of the sample surface by scanning it with a pointed needle and measuring the probe-specimen interaction.

The first SPM, the Scanning Tunneling Microscope (STM) Was invented by Heinrich Rohrer and Gerd Binnig in 1981. They received Nobel prize in 1986-ban.

The measured interaction is the mechanical force between the probe tip and specimen surface

### Force Between the Probe Tip and Specimen

- The probe:
- typically 100  $\mu\text{m}$  long, 1  $\mu\text{m}$  thick, V shaped
  - Small spring constant
  - large resonance frequency
  - silicon (-oxide, -nitride)

### Contact Mode AFM

The needle and specimen are in constant contact. It works in the repulsive range. It keeps the force constant: follows the topography of surface. The vertical deformation of the probe is detected. Local Force Spectroscopy: The force / displacement function can be recorded at a given point on the surface.

### Tapping Mode AFM

The needle vibrates with an amplitude of 20-100 nm and touches the surface at each vibration. The amplitude and phase of the vibration change as the probe passes above hills and wells of the surface.

### Comparison of the Contact and Tapping Mode

#### Contact Mode AFM

##### Advantages:

quick scan  
atomic resolution  
good for rough surfaces

##### Disadvantages:

horizontal forces distort the image  
distortion due to water on the surface  
can scratch soft biological samples

#### Tapping Mode AFM

##### Advantages:

higher lateral resolution  
damaging less soft samples

##### Disadvantages:

slower scanning

### AFM Images of Biological Samples

Heat shock proteins

Red blood cells

### AFM Image of Extra-Cellular Connexon

Calcium-induced conformational changes in the extra-cellular connexon surface.

The line is 23 nm long.

### The Electron as a Wave

Louis de Broglie:

$$\lambda = h / p$$

$\lambda$  – wavelength of the electron

$h$  – Planck's constant

$p$  the momentum of the electron

Louis-Victor-Pierre-Raymond de Broglie  
the 7th duke of de Broglie

### Transmission Electron Microscope

The microscope built by Ruska in 1933

Ernst August Friedrich Ruska and Max Knoll built the first electron microscope in 1931. Ruska received Nobel prize in 1986.

### Amyloid Fibrils in Transmission Electron Microscope

Binding of cholesterol to amyloid fibrils.

### SEM

### SEM Image of Pollen Particles

### SEM Image of Blood Cells

### Comparison of the Optical and the Electron Microscope

- small depth of field
- low resolution
- + live sample, life processes
- + at atmospheric pressure

- + large depth of field
- + high resolution
- fixed sample
- in a vacuum
